

Part no. WH-DRL-NONUSA

2008-2016 Yamaha R6 Non-USA model LED DRL hookup harness

For Non-USA models that do not support DRL functionality on the front indicators, these models can be identified by having only 2-wire front turn signals (third position in connector is blank). This harness will draw the power from the front LED pilot light (below windscreen) to power up the DRL light bars.

Countries identified so far requiring this harness: Europe (All), Australia, Japan, Taiwan, Russia, and Mexico

Installation:

During re-installation of the 2 air intake sensors, there is a third plug where this harness needs to plug in between, then connect the other ends to the left and right DRL power wire (single red wire plug). See illustration below. The splitter harnesses from the kit will not be used.
